PROJECT REPORT

PROJECT OVERVIEW

EventForce Management System is a Salesforce-based CRM solution designed for Event Planner Solutions to centralize and streamline event planning operations. The system connects event bookings, clients, vendors, venues and feedback in one workspace. It supports event scheduling, venue reservations, vendor coordination, cancellation approvals, client reminders and operational reporting.

Business Overview

Event planning involves multiple stakeholders and time-sensitive activities. Managing client details, venue availability, vendor assignments and event status through disconnected records can increase manual effort and create coordination gaps. EventForce uses Salesforce objects, relationships, automation and security controls to provide a common source of information for event coordinators and administrators.

Purpose

- Centralize event, client, vendor, venue and feedback information.
- Streamline bookings, reservations and vendor coordination.
- Automate reminders, cancellation approvals and status updates.
- Improve visibility through reports and dashboards.
- Support controlled access and consistent data management.

Objectives

- Digitize core event-management operations in Salesforce.
- Reduce repetitive manual processes and improve booking efficiency.
- Maintain accurate event budgets and booking data.
- Prevent venue double bookings and manage availability.
- Provide operational insights and a foundation for future growth.

IDEATION PHASE

Problem Statement

User / Area	Need	Operational Challenge
Clients	Request event services and updates	Booking status and communication need to be visible.
Event Coordinators	Schedule events and manage approvals	Many tasks and stakeholders require coordination.
Vendors	Deliver assigned services	Assignments and availability must remain current.
Venue Managers	Manage venue reservations	Conflicting bookings must be prevented.
Administrators	Oversee records and access	Data quality, security and monitoring are required.

Solution Approach

Approach	How it handles the requirement	Consideration
Manual records	Tracks each activity separately	High manual effort and fragmented data.
Spreadsheets	Stores bookings and contact details	Manual synchronization and limited automation.
Standalone application	Builds custom event modules	Requires separate development and maintenance.
Salesforce CRM	Connected objects, Lightning UI, Flow and Apex	Selected platform for unified CRM workflows.

Selected Platform – Salesforce

- Connected data model links events with clients, venues and vendors.
- Flow and approval tools automate business processes.
- Apex supports advanced venue-availability and double-booking logic.
- Profiles, roles and sharing settings help control access.
- Reports and dashboards provide operational visibility.

REQUIREMENT ANALYSIS

Business Requirements

- Maintain event details including type, date, status and calculated budget.
- Maintain client contact and location information.
- Maintain vendor service types and availability status.
- Maintain venue address, location, capacity and availability.
- Link feedback to the related event and client.
- Support event cancellation requests and approval decisions.
- Send client reminders three days before confirmed events.
- Prevent two events from using the same venue on the same date.
- Provide reports and dashboards for event operations.

Functional Requirements

ID	Requirement
FR-01	Create and manage Event, Client, Vendor, Venue and Feedback records.
FR-02	Relate events to clients and venues using lookup relationships.
FR-03	Link Events and Vendors through a junction object.
FR-04	Calculate event budget from the selected event type.
FR-05	Validate client email format.
FR-06	Manage cancellation approval and status updates.
FR-07	Send a three-day reminder for confirmed events.
FR-08	Update venue availability and prevent duplicate bookings.
FR-09	Provide role-based record access.
FR-10	Generate reports and dashboards.

Non-Functional Requirements

NFR	Description
Usability	Provide a clear Lightning application for event operations.
Security	Use profiles, roles, permission sets and sharing controls.
Data Accuracy	Use validation rules, formulas and automation.
Reliability	Run configured flows and Apex logic consistently.
Maintainability	Keep automation and configuration organized.
Scalability	Allow additional events, clients, vendors and venues.

DATA MODEL

Core Objects / Modules

Object	Purpose / Key Fields
Event__c	Event Name, Event Date, Event Type, Event Status, Event Budget
Client__c	Client Name, Email, Phone, Address, Country, City
Vendor__c	Vendor Name, Email, Phone, Service Type, Status
Venue__c	Venue Name, Address, Location URL, Capacity, Availability Status
Feedback__c	Feedback ID (Auto Number), Rating, Comments
EventVendor__c	Junction object linking Event and Vendor in a many-to-many relationship.

Data Relationships

Relationship	Type / Purpose
Event → Client	Lookup; connects a booking to its client.
Event → Venue	Lookup; identifies the reserved venue.
Feedback → Event	Lookup; associates feedback with an event.
Feedback → Client	Lookup; identifies who submitted feedback.
EventVendor → Event	Master-Detail relationship.
EventVendor → Vendor	Master-Detail relationship.

Business Flow

Client Request → Event Record → Venue Selection → Vendor Assignment → Booking Status → Event Delivery → Feedback Collection

The data model provides a connected structure for event planning. The EventVendor junction object enables multiple vendors to be associated with an event and supports vendors being assigned to multiple events.

BACKEND & AUTOMATION

The backend phase configures the functional engine of EventForce using Salesforce declarative automation, Apex logic and security settings. Record-Triggered Flows, validation rules, formula fields and approval processes support routine business operations, while Apex classes and triggers handle advanced booking rules.

Automation Components

Component	Role in the Project
Record-Triggered Flow	Schedules and sends client reminders for confirmed events.
Validation Rules	Check entered values, including client email format.
Formula Fields	Calculate event budget based on event type.
Approval Process	Routes cancellation requests for review and applies decision actions.
Apex Class / Trigger	Updates venue availability when event status changes.
Apex Trigger	Prevents conflicting event bookings at a venue and date.
Batch Apex	Processes past events and marks them Completed.
Scheduled Apex	Runs recurring batch processing on a schedule.

Key Automation Scenarios

- A confirmed event with a valid client email receives a reminder three days before its event date; the event owner is copied.
- Cancellation requests enter an approval process when status is Pending Cancellation.
- Approval and rejection actions update event status and send notifications.
- Confirmed events mark the selected venue Reserved; canceled events mark it Available.
- A trigger blocks a second event at the same venue on the same date.
- Scheduled batch processing marks past events Completed.

CONFIGURATION & VALIDATION

Event Fields

Field	Type / Values
Event Type	Picklist: Wedding, Corporate, Birthday, Anniversary, Festival, Concert, Other
Event Date	Date
Event Status	Picklist: Planned, Confirmed, Completed, Pending Cancellation, Canceled, Rejected
Event Budget	Currency formula based on Event Type.

Budget Formula Logic

Event Type	Budget (currency units)
Wedding	50,000
Corporate	30,000
Birthday	10,000
Anniversary	20,000
Festival	60,000
Concert	40,000
Other	15,000

The Event Budget formula returns a currency value according to the selected Event Type. These amounts are the configured sample values in the supplied implementation guide.

Other Field Configuration

- Client fields include Email, Phone, Address, Country and City.
- Vendor fields include multi-select Service Type, Email, Phone and Status.
- Venue fields include Address, Location URL, Capacity and Availability Status.
- Feedback includes a 1–5 Rating picklist and Comments long-text field.
- Feedback Event lookup can be filtered by the selected Client to show only that client's events.

Validation Rule

A validation rule named Email_Valid_Address checks the Client Email field using a regular expression and displays “Please Enter Valid Email Address” when the value does not match the expected email format.

APPROVAL PROCESS & FLOW

Event Cancellation Approval

The approval process is configured for Event records with Event Status = Pending Cancellation. The initial submitter is the Event Owner. The process routes the request to a designated approver or the submitter's manager, depending on the selected configuration.

- Create email templates for cancellation request, client cancellation notice, owner approval and owner rejection.
- Submit a cancellation request when the event enters Pending Cancellation.
- Notify the Event Coordinator or configured recipient about the request.
- On final approval, update Event Status to Canceled and notify the Event Owner.
- On rejection, send a rejection notification and apply the configured rejection status action.

Three-Day Client Reminder Flow

- Use a Record-Triggered Flow on Event when a record is created or updated.
- Set entry criteria to Event Status = Confirmed and optimize for Actions and Related Records.
- Add a scheduled path using Event Date with an offset of three days before.
- Compose a plain-text subject and body using event, client, venue and event-type details.
- Use the Send Email action to send to the Client Email and CC the Event Owner.
- Save and activate the flow as Client Reminder - 3 Days Before.

These automations are intended to improve timely communication and ensure cancellation decisions and reminders are reflected in the CRM workflow.

APEX DEVELOPMENT

Venue Availability Update

The supplied guide defines a VenueStatusHelper Apex class invoked by an after-insert and after-update trigger on Event__c. For events with a selected venue, a Confirmed status sets venue availability to Reserved; a Canceled status sets it to Available.

Double-Booking Prevention

The PreventDoubleBooking before-insert and before-update trigger checks events that share a venue. If an existing event is found for the same venue and date, the incoming record receives an error: “This Venue is already booked on this date.”

Batch and Scheduled Apex

- BatchCompleteEvents queries past events that are not already Completed and updates their status to Completed.
- ScheduleCompleteEvents implements Schedulable and launches the batch class.
- The guide configures a recurring schedule named Daily Event Completion at 08:00 PM, selecting all days.

Implementation Consideration

The supplied material describes the Apex scenarios and configuration. Production use should include bulk-data testing, handling of venue changes, cancellation edge cases, and verification of scheduled jobs in the target Salesforce org.

LIGHTNING UI & ANALYTICS

The Event Planner Lightning application organizes the major EventForce modules in one workspace. The app navigation is configured to provide access to Events, Clients, Vendors, Venues, Feedback, Reports and Dashboards.

Lightning App

- Create a Lightning app named Event Planner through App Manager.
- Add the Event, Client, Vendor, Venue and Feedback tabs.
- Include Reports and Dashboards in navigation.
- Assign the app to the intended profile(s), including System Administrator as described in the guide.
- Use the App Launcher to open and verify the application.

Reports

The guide specifies an EventForce Report folder and an Upcoming Events by Month report. The report includes Event Name, Event Date, Event Type, Client, Venue and Event Budget. Filters focus on upcoming events and exclude canceled records; grouping by calendar month and budget summaries support planning visibility.

Dashboard

The EventForce Operations Dashboard uses the Upcoming Events by Month report as a widget. The guide suggests a donut chart with up to six values and the subtitle “Upcoming Events Overview.”

User Experience

The single-app navigation reduces the need to move between separate work areas. Reports and dashboards provide summarized views of upcoming events, event budgets and operational activity.

DATA & SECURITY

Data Migration

- Prepare and validate records before import to reduce duplicates and inconsistent values.
- Use the Data Import Wizard for Events, Clients, Vendors, Venues and Feedback.
- Check relationships and required fields after importing sample data.
- The guide recommends creating sample records in each object before building reports.

Profiles and Roles

Profile / Role	Access Summary in Guide
Event Admin	Cloned from System Administrator; broad administrative access.
Event Coordinator	Event create/read/edit/delete; client read/edit; vendor and venue read; feedback create/read.
Vendor Manager	Vendor create/read/edit/delete; event, venue, client and feedback read-only.
Client	Read-only access to own events; create/read feedback; no vendor/venue access.

Permission Sets and Sharing

- Feedback Manager permission set grants additional Feedback object permissions and is assigned to the Event Coordinator user in the guide.
- Event object Organization-Wide Defaults are configured as Private for internal and external access.
- Event_Sharing_For_Vendors shares records owned by the Event Coordinator role with the Vendor Manager role using Read Only access.
- Role hierarchy, sharing rules and permission sets complement profile permissions to support controlled access.

Security Objective

The security model is designed to give users access according to their responsibilities while protecting client and event information. Access should be reviewed against actual organizational roles before deployment.

TESTING & DEPLOYMENT

Testing Areas

Test Area	Expected Behaviour
Event Data	Required details and relationships are stored correctly.
Email Validation	Invalid client email values are blocked with an error.
Budget Formula	Budget reflects the configured Event Type.
Cancellation Approval	Requests route for review and apply decision actions.
Three-Day Reminder	Eligible confirmed events trigger a reminder on schedule.
Venue Availability	Confirmed and canceled events update venue status.
Double Booking	Same venue/date conflicts are prevented.
Batch Completion	Past non-completed events are updated to Completed.
Access Control	Profiles, roles and sharing rules expose only permitted records.
Reports & Navigation	App tabs, report and dashboard open as configured.

Deployment Strategy

The guide states that the project was configured in a Salesforce Developer Edition org. Actual production deployment was not performed. A live rollout would require a suitable sandbox, metadata migration using approved Salesforce deployment tools, environment-specific configuration, testing and release management.

Maintenance and Monitoring

- Monitor Flow interviews, Apex jobs and approval processes for failures.
- Review data accuracy, duplicate records and relationship integrity.
- Troubleshoot access conflicts and update permissions as roles evolve.
- Test changes to validation rules, formulas and automation before release.
- Maintain documentation of objects, fields, flows, Apex, reports and security settings.

CONCLUSION

Advantages

- Centralized CRM for event, client, vendor, venue and feedback records.
- Automated reminders and cancellation approval workflows.
- Venue availability management and double-booking prevention logic.
- Role-based access and sharing controls.
- Reports and dashboards for upcoming-event visibility.
- Extensible Salesforce platform for future workflows and integrations.

Limitations / Scope Considerations

- The implementation is documented within a Developer Edition environment.
- Actual production deployment is not established in the supplied guide.
- Business operation depends on accurate record entry and maintained relationships.
- Real-world use requires additional testing, security review and environment-specific release planning.

Conclusion

The EventForce Management System demonstrates how Salesforce can support event-planning operations through custom objects, relationships, automation, Apex logic, a Lightning application and analytics. The design brings client bookings, venue reservations, vendor coordination, cancellation approvals and feedback into a connected CRM environment. The supplied implementation guide documents the configuration approach and intended workflows, while identifying production deployment as a separate activity.

FUTURE SCOPE & APPENDIX

Future Scope

- Enhance event analytics with richer operational dashboards.
- Extend vendor scheduling and performance tracking.
- Add advanced client communication and event-status notifications.
- Expand venue search and availability management.
- Introduce integrations with payment, calendar or messaging services where required.
- Improve mobile usability and support larger operational datasets.
- Establish a formal sandbox-based deployment and release pipeline.

Core Technologies / Salesforce Features

- Salesforce Developer Edition
- Custom Objects and Relationships
- Lightning App Builder
- Record-Triggered Flow and Scheduled Paths
- Validation Rules and Formula Fields
- Approval Processes and Email Alerts
- Apex Classes and Triggers
- Batch Apex and Scheduled Apex
- Profiles, Roles, Permission Sets and Sharing Rules
- Data Import Wizard, Reports and Dashboards

Project Modules

Module	Purpose
Events	Event details, type, date, status and budget.
Clients	Client contact and location data.
Vendors	Vendor contact, service types and status.
Venues	Venue details, capacity and availability.
Feedback	Client rating and comments.
Event Vendor	Many-to-many association between events and vendors.

THANK YOU
